

[Continued: Comments For (2.)]

- ~~The~~ ~~amplitude~~ During the first measurements, we used an amplitude A of the NMR-signal as low as possible, assuming that this would imply less noise.

This led to ~~an~~ a complicated procedure of ~~then~~ fine tuning I ~~and~~ and readjusting ~~the~~ A alternately.

Later on, starting at 2.6, we used higher amplitudes A , as we realized that the signal was seen as well, but measuring was much easier.
